

Mastering Context Engineering: The RCE Video Learning Companion.

Scope

5 Chapters | 40 Videos

49:48 Total Runtime

Assessment

80 Retrieval Checks

6 Applied Scenarios

Architecture

100% Browser-Local Data

Zero Telemetry

Passive consumption creates the illusion of competence. **This engine requires active proof.**

What It Is **NOT**

No remote learning databases or accounts.

No external AI systems grading lab work.

No telemetry, advertising, or public leaderboards.

What It **IS**

A deterministic, mobile-first browser-local application.

Locally installed package requiring manual media routing.

An honesty-driven spaced review and diagnostic practice engine.

The Four Pillars of Evidence: Separating exposure from applied mastery.

Learning Activity

Video Progress
(Exposure)

Metric: Furthest
timeline position.
Trigger: Automatically
completes at exactly
90% or via manual
action.

Retrieval History
(Recall)

Metric: 80 low-stakes
checks.
Tracking: Responses,
confidence levels,
review marks, and
attempt schedules.

Applied-Lab Work
(Application)

Metric: 6 source-
grounded scenarios.
Tracking: Drafts,
submissions, and
documented criterion
coverage.

Personal Study Data
(Context)

Metric: Learner
insights.
Tracking: Timestamped
bookmarks and inert
plain-text notes.

Use them together: None of these individual pillars
alone proves reliable real-world performance.

Phase 1 — Active Exposure: Anatomy of the Study Rail.

1. Progress vs. Playback:
Progress tracking freezes the furthest point reached, allowing backward seeking without penalty.

Why AI Models Guess Wrong

Mark video complete

2. The Anchor: Distills the video into a single, retainable takeaway to prevent cognitive overload.

Core concept:

Root cause of guessing: missing exact current values.

Timestamped bookmarks and personal notes

Add a plain-text note about this moment.

Save bookmark at current time

Visual Reinforcement

3. Inert Plain-Text:
Bookmarks save the exact moment alongside personal notes (e.g., unresolved questions or implementation impacts).

4. Visual Reinforcement:
Adjacent diagrams clarify relationships while media plays.

Phase 2 – Diagnostic Recall:

The system runs on the Honesty Principle.

The Check

Exactly two source-grounded, low-stakes checks follow every video. Answers must be retrieved from memory before reopening source material.

- ☒ A. Core concept
- ☐ B. Implementation detail
- ☐ C. Missing value

Submit →

The Insight

The Aha Moment: Because this is a deterministic, local application with no AI grading, the 'Confidence Toggles' and 'Mark for Review' flags only work if you actively self-diagnose your gaps.

Wrong answers are valuable diagnostic evidence, not a penalty score.

Phase 3 — Spaced Review: The deterministic priority queue.

An empty queue is normal. Items only return when a review date arrives or a weak area is mathematically identified.

Phase 4 — Applied Practice: The Interactive Context Engineering Lab.

The Boundary of Feedback:

Criterion representation vs. real-world mastery.

What the System Evaluates (Deterministic)

Documented criterion coverage in lab drafts.

Exact timestamp recall and historical attempt tracking.

Low-stakes, source-grounded memory checks.

What Requires Human Judgment (Real-World)

Professional correctness and safety of context packages.

Deployment readiness and mitigation of failure patterns.

Legal compliance, security, and financial determinations.

A polished response can still miss a required criterion; a represented criterion does not prove the real-world plan is safe.

Data Sovereignty:

The export and independent reset boundary matrix.

	Data Area	Reset Action Removes	Data Preserved	Export Format
1	Video Progress	Completion & playback state	All other data	N/A in end-user controls
2	Bookmarks & Notes	Selected collections only	All other data	JSON (validated) & Markdown (readable)
3	Retrieval History	Attempts, confidence, schedules	Video, notes, and lab work	JSON
4	Applied Lab	Scenario drafts and submissions	Video, notes, and history	JSON (with validated preview)

Crucial: Create JSON exports before clearing browser site data or changing devices. There is no cloud backup.

The Blueprint: Optimize for understanding, not dashboard completion.
