

# Enterprise Operationalization

Turning Useful AI Prototypes into Governed, Trustworthy Systems

|  |                                         |                              |
|--|-----------------------------------------|------------------------------|
|  | PROJECT:<br><b>AI SYSTEM DEPLOYMENT</b> |                              |
|  | DRAWING NO.:<br><b>EOB-001</b>          |                              |
|  | REV.:<br><b>A</b>                       | DATE:<br><b>OCT 26, 2024</b> |
|  |                                         |                              |

# The 7-Step Enterprise Blueprint

# Step 1: The Maturity Shift

**Prototype asks:**  
Can this prompt produce a good answer?

**Enterprise asks:**  
Can this workflow be used repeatedly safely?

The Maturity Shift Matrix

|             | Prototype            | Enterprise                           |
|-------------|----------------------|--------------------------------------|
| Ownership   | Individual builder   | Cross-functional (Legal, IT, Ops)    |
| Controls    | Ad-hoc editing       | Versioned production assets          |
| Evidence    | Curated demo success | Minimum viable auditability          |
| Maintenance | Fix on failure       | Regression sets and drift monitoring |

# Step 2: Data Privacy & Minimization

| Data Classification Handling Table |                       |                                                                 |
|------------------------------------|-----------------------|-----------------------------------------------------------------|
| Classification Type                | Examples              | Handling Instructions                                           |
| Public                             | Published policies    | Safe to include directly.                                       |
| Internal                           | Playbooks             | Usable with access controls; extract only needed subsets.       |
| Confidential                       | Contracts, financials | Minimize aggressively; prefer summaries or transformed fields.  |
| Regulated                          | PII, PHI, PCI         | Requires explicit permission; mandate masking and tokenization. |

## Step 3: Policy & Brand Integration

You Are Here: Step 3

Operationally strong refusals guide the user toward what is allowed, rather than merely blocking what is disallowed.

## Step 4: Security & Safety Layering

You Are Here: Step 4

**Treat retrieved passages, uploaded files, and pasted business documents as untrusted input until separated from trusted instructions.**

# Step 5: Resource & Performance Budgeting

You Are Here: Step 5

## Complexity Routing

## Balancing Trade-offs

Quality/Capability

Latency/Cost

**Context bloat** creates **operational debt**. More context slows response time, increases cost, and dilutes the instruction signal.

# Step 6: The Governed Release

Uncontrolled prompt editing is the fastest way to create enterprise instability.  
Prompts and context rules are versioned production assets.

## Step 7: Continuous Monitoring & Auditing

Metrics should point toward review, not replace it. Monitoring creates false assurance unless tied to specific thresholds and responder actions.

# The Enterprise Governance RACI

Cross-functional roles required for successful launch readiness.

| Role                   | Primary Operational Responsibility                                         |
|------------------------|----------------------------------------------------------------------------|
| Product/Business Owner | Defines success criteria, rollout intent, and consequences to avoid.       |
| Legal/Compliance       | Reviews data handling, policy boundaries, and retention constraints.       |
| Security/IT            | Approves access patterns, threat handling, and environment controls.       |
| Domain Expert          | Confirms content accuracy and escalation rules match the business context. |
| Operations             | Monitors production behavior, triages incidents, and manages maintenance.  |

# Fail-Safes and Back-off Plans

Designing for real conditions, not ideal ones.

# Synthesis: The Launch Readiness Dashboard

Are we actually ready to launch?

## The Enterprise Fail-Safe Dashboard

### ☐ Data Handled

Are classifications understood and sensitive elements masked?

### ☐ Boundaries Set

Are refusal and escalation routes explicitly defined in policy blocks?

### ☐ Shields Up

Are untrusted inputs separated from system instructions?

### ☐ Budget Enforced

Is the token footprint lean and complexity routed correctly?

### ☐ Tested & Versioned

Has the regression set been run on the exact release candidate?

### ☐ Rollback Ready

Are monitoring thresholds agreed upon, and is the rollback owner identified?

Launch readiness is judged by discipline, not enthusiasm.
