

Mastering the Reliability Triage Console

A definitive guide to diagnosing AI failures, applying targeted fixes, and preserving the lesson.

The Four Pillars of Reliable Diagnosis

Architecture of the Diagnostic Workspace

Zone 1: Evidence Panel

Displays competing materials.
Tracks authority, trust,
freshness, and content.

Zone 2: Workspace Pane

The active mission layer.
Holds step objectives,
diagnostic choices, and
primary navigation.

Zone 3: Coach Dock

A fixed dashboard for live
scoring signals, impact
maps, and immediate
teaching prompts.

The Seven-Step Diagnostic Mission

The mission spine remains identical across every scenario, stabilizing the review process even when content changes.

Orient and Anchor to the Evidence

Strong Choice	Weak Choice
Anchors to the most authoritative and current source (e.g., Current warranty policy update).	Anchors to the most familiar wording or convenient nearby clue (e.g., Older FAQ snippet).

Key Insight: Mark the source-of-truth evidence as 'Reviewed' before diagnosing to prevent relying on memory or tone.

Narrowing the Diagnosis

TEACH-BACK FEEDBACK

Why this works: The path correctly identifies that the 'Visible Symptom' and 'Grounding Status' are insufficient on their own. By layering on 'Instruction Pressure' and finally 'Historical Context', the system successfully eliminates ambiguity and isolates the precise root cause.

Why other options were weaker:

- Nearby alternatives often stop at 'Grounding Status' without considering the full 'Historical Context', leading to a broader, less accurate diagnosis.
- Ignoring 'Instruction Pressure' can lead to misinterpreting the urgency or specific constraints.

Treat Teach-Back Feedback as a mini-debrief. It explains exactly why the selected path works and why nearby alternatives lose, allowing real-time course correction.

Naming the Precise Failure Mode

Column 1: Outward Pattern	Column 2: Plausible Root Cause
Format drift	Missing grounding
Hallucination	Superseded authority
Stale context	

Name the primary failure mode that fits the evidence.

Name the defensible explanation for why the pattern occurred.

Diagnostic Debt

Avoid vague claims like “the model was bad”. A broad diagnosis invariably leads to a noisy, overly large repair.

Applying the Smallest Credible Fix

The External Validation Loop

Insight Text: The app is strictly static and local. It uses heuristics to judge if control signals improved based on your pasted evidence, preserving data privacy.

Preserving the Lesson with Regression

Write concrete, reusable guards.

Require the answer to cite Section 4.2 or explicitly route to Finance Operations.

Avoid vague behavioral reminders.

Remind the team to be careful with old snippets.

A strong regression check must be **specific** enough that another reviewer could run it systematically later without guessing the original intent.

Debriefing and Analytics Review

MISSION SUMMARY

Compare your path against strongest practice

Open-detailed import

SOURCES OF TRUTH The current currently policy option.	STRONGEST-PRACTICE PATH The current currently policy option.	Aligned
OBSERVABLE SYMPTOM The observ aviluted ousorised obsevation instead of the current policy.	STRONGEST-PRACTICE PATH The observ valuated outdated observation instead of the current policy.	Aligned
GROUNDING DIAGNOSIS The obveve grounded shaft in a stale oligged instead of the current policy amwve.	STRONGEST-PRACTICE PATH The observ grounded shaft in a stale oligged instead of the current policy amave.	Aligned
PRIMARY FAILURE MODE Starr or stdsy resolver	STRONGEST-PRACTICE PATH Stalf or stoisy recviner	Aligned
LIKELY ROOT CAUSE The assistant needs a different support	STRONGEST-PRACTICE PATH Un current policy.	Different
SMALLEST CREDIBLE MITIGATION Prioritder current polley surcess with Iniposaoos and authority checks refave clieir with mligpots are allioned to grow in the answer.	STRONGEST-PRACTICE PATH Prierient current pelley surcess with servicess and authority checks rellere clien with mligests are akowed ox glao in the answer.	Aligned
REGRESSION CHECK Add a standing that warranty conrens for new poltlloniss neat renlerens the curvent polley servem and recek menermd 24 month cuoatng	STRONGEST-PRACTICE PATH Priore stamdng that warranty warorts for new prnlnfrens nees renlenens the current policy servem and recek repoesed 24 month ouantng	Aligned

Compare your operational logic against the ideal path. Focus on where your logic diverged, not just the final outcome.

Decoding Real-Time Teaching Signals

The Coach Lens

Translates the current run into plain-language guidance.

The Playbook Lens

Explains the underlying logic of the scenario.

Central Rule: Use signals to understand why a specific path is stronger based on evidence, not to blindly hunt for the highest score.

Choosing Your Workspace Mode

 Guided Mode (Default)	 Professional Mode
Best for: • First-time users, classroom training, deliberate learning.	Best for: • Experienced users executing rapid replay cycles.
Features: • Active Teach-back feedback, highly visible coaching prompts, full Playbook access, interpretive scaffolding.	Features: • Identical step flow and scoring, but suppresses helpers and Playbook lenses for a faster, lighter workspace.

The Scenario Progression Taxonomy

The Golden Rules of Reliability Triage

Rule 1: "Visible First"

Diagnose from the observable symptom. Do not jump immediately to hidden-model theories.

Rule 2: "Anchor First"

Define the governing source before comparing nearby clues or helpful-sounding instructions.

Rule 3: "Narrow Diagnosis"

Prefer the narrowest explanation that still fits the evidence.

Rule 4: "Smallest Fix"

Choose the most targeted, credible mitigation you could validate on the next run.

Rule 5: "Concrete Guard"

Write regression checks that another human reviewer could execute without guessing.

Identify what should have governed, isolate the failure, test a narrow repair, and capture the lesson.
